Match the configuration management activities.

Keeping track of requests for changes to the software from customers and developers, working out the costs and impact of changes, and deciding the changes should be implemented

Change management

The process of assembling program components, data and libraries, then compiling these to create an executable system

System building

Preparing software for external release and keeping track of the system versions that have been released for customer use

Release management

Keeping track of the multiple versions of system components and ensuring that changes made to components by different developers do not interfere with each other

Version management

Cevabınız doğru.

Doğru cevap:

Keeping track of requests for changes to the software from customers and developers, working out the costs and impact of changes, and deciding the changes should be implemented → Change management,

The process of assembling program components, data and libraries, then compiling these to create an executable system → System building,

Preparing software for external release and keeping track of the system versions that have been released for customer use → Release management, Keeping track of the multiple versions of system components and ensuring that changes made to components by different developers do not interfere with each other → Version management

Match the configuration management activities.

A sequence of baselines representing different versions of a system.

Mainline

A shared database of versions of software components and meta-information about changes to these components

Repository

An instance of a configuration item that differs, in some way, from other instances of that item

Version

collection of component versions that make up a system

Baseline

The creation of a new version of a software component by merging separate versions in different codelines

Merging

The creation of a new codeline from a version in an existing codeline.

Branching

Cevabınız doğru.

Doğru cevap: A sequence of baselines representing different versions of a system. → Mainline,

A shared database of versions of software components and meta-information about changes to these components → Repository,

An instance of a configuration item that differs, in some way, from other instances of that item → Version,

collection of component versions that make up a system → Baseline,

The creation of a new version of a software component by merging separate versions in different codelines → Merging,

The creation of a new codeline from a version in an existing codeline. → Branching
